To root your Laravel-Vue project from `C:\Users\RM\Music\NDUKO` on your PC to another PC, follow these steps:

1. Copy the Project to the New PC

Transfer the entire `NDUKO` project folder to the new PC via USB, network, or Git (recommended).

2. Install Required Dependencies

On the new PC, install the following if they are not already installed:

- **PHP** (Check Laravel version requirements)
- **Composer** (for managing PHP dependencies)
- **Node.js** and **npm** (for Vue and frontend dependencies)
- **Laravel** (`composer global require laravel/installer`)
- **Database Server** (MySQL/PostgreSQL, etc.)
- **Web Server** (Apache/Nginx, or Laravel's built-in server)

3. Navigate to the Project Folder

```
sh
CopyEdit
cd path/to/NDUKO
```

4. Install Backend Dependencies

Run:

```
sh
CopyEdit
composer install
```

5. Install Frontend Dependencies

Run:

```
sh
CopyEdit
npm install
```

6. Set Up the `.env` File

- Copy the `.env.example` file and rename it to `.env`
- Update database credentials and any other necessary configurations.

7. Generate Application Key

Run:

```
sh
CopyEdit
php artisan key:generate
```

8. Run Migrations & Seed Database (If Needed)

```
sh
CopyEdit
php artisan migrate --seed
```

9. Serve the Laravel Backend

Run:

```
sh
CopyEdit
php artisan serve
```

Or configure it with Apache/Nginx.

10. Run Vue Frontend

If using Vue CLI:

```
sh
CopyEdit
npm run serve
```

If using Vite:

```
sh
CopyEdit
npm run dev
```

After these steps, your Laravel-Vue project should be running on the new PC. Let me know if you need further assistance! 🚀
